A decision record for planning teams.

Udgass is a decision intelligence engine in development. It connects business history, decisions and measured outcomes, so an organisation can see what is changing and weigh its options with the evidence in view.

> **Status.** Early development. No production deployments and no customer results yet. Examples shown on our website are illustrative. This brief describes intended design and a proposed pilot, not a finished product.

THE PROBLEM

History is recorded. The link is not.

Inputs sit in one system, the forecast in another, the decision in an email and the outcome in a report months later. Without the link between the evidence available, the decision taken and the result, an organisation cannot tell whether its judgement or its models are improving.

THE APPROACH

A durable decision record

For each decision, Udgass is designed to keep: the question and its owner; the evidence considered; the estimate with an explicit uncertainty range; the assumptions; the action taken; the realised outcome; and the variance between estimate and outcome.

It reconciles estimates with outcomes and reports its own accuracy over time, including where it is wrong.

FIRST APPLICATION

Demand and inventory planning

A recurring decision with quantifiable outcomes and material operating consequences. Questions in scope: what range of demand to plan for; which products carry elevated shortage risk; where excess stock may build up; how supplier delays would change the outcome.

PROPOSED PILOT

A backtest on your own history

We replay your past using only what was known at the time, then compare each estimate with what actually happened. No live systems are touched. Nothing is used for real decisions until you choose.

01
Agree the scope
One product group or decision and the history to use. Scope and duration agreed up front.

02
Replay the past
Estimates for chosen past dates, from data available then only.

03
Compare
Accuracy against actual outcomes, including failures.

04
Decide together
A written report. You choose whether a live trial is worthwhile.

What we would need

- Exports of sales, orders and stock history
- Product and supplier reference data, where available
- A named decision owner
- A few conversations about how planning decisions are made today

What you would get

- A written report: estimates, outcomes, accuracy and failures
- A view of how the decision record would look on your data
- No cost and no commitment at this stage of development

SECURITY AND DATA HANDLING

Design intent, stated plainly

Read-only by design	Intended to read from source data and advise. Not designed to write back to your systems or execute actions, and will not need credentials that allow it to.
Exports first	Early work uses exports your team chooses to provide. No direct connection to live systems in the first stage.
Only the data it needs	Operational history, not personal customer data. We intend to request only the fields the work requires.
Traceability	The decision record is intended to show which data each estimate was built from.
Agreed in writing	Storage, access, and return or removal of data are defined and agreed in writing before any data is shared.
Current status	No security certifications. No independent security audit yet. Retention and removal process not yet defined. Please do not send sensitive or personal data until terms are agreed.

WHO IS BUILDING IT

Kanthipriya Mahale, KPAppWorx

More than nine years of safety-critical embedded software engineering in aerospace and automotive, under DO-178C and ISO 26262, and 13 products shipped through KPAppWorx. Udgass applies the same habits (evidence, traceability, stated uncertainty, accountability) to business decisions. This is a working discipline, not a claim that Udgass is certified to any standard.
